Title

Combined Channel Coding and Space-Block Coding in a Multi-Antenna

Arrangement

ASSISTANT COMMISSIONER FOR PATENTS WASHINGTON, D.C. 20231
SIR:

IC.

AMENDMENT

In response to an Office action dated March 12, 2002, please amend the aboveidentified application as follows:

IN THE SPECIFICATION:

Page 5, replace the paragraph beginning at line 19 with:-

Increased data rate is achieved by, effectively, splitting the incoming data rate into multiple channels, and each channel is transmitted over its own terminal. Viewed another way, information symbols from a transmitting terminal is split into L parallel streams. Stream l is encoded using a channel code with rate R_l and then coded with a space-time block encoder with N transmitting antennas. Advantageously, the coding rates are chosen such that $R_1 < R_2, < \cdots, < R_k$.—;

Page 14, replace the paragraph beginning at line 8 with:--

FIG. 2 presents an arrangement for increasing the data rate or throughput in wireless systems. In FIG. 2, the information to be transmitted is demultiplexed in element 40 into two streams. One stream is applied to channel encoder 41, and the other stream is applied to channel encoder 51. The output of channel encoder 41 is applied to space-time block encoder 42, and then to mapper and pulse shaper 43 and antennas 44 and 45. Similarly, the output of channel encoder 51 is applied to space-time block
